### **CERTIFICATE**

This is certified that **Utkarsh Mishra** (0901CS201130) has submitted the project report titled **Rain Prediction Model using ML** under the mentorship of **Dr. Ranjeet Kumar Singh**, in partial fulfilment of the requirement for the award of degree of Bachelor of Technology in Computer Science and Engineering from Madhav Institute of Technology and Science, Gwalior.

**Dr. Ranjeet Kumar Singh**  
Faculty Mentor  
Assistant Professor  
Computer Science and Engineering

(A Govt. Aided UGC Autonomous & NAAC Accredited Institute Affiliated to RGPV, Bhopal)

## **DECLARATION**

I hereby declare that the work being presented in this project report, for the partial fulfilment of requirement for the award of the degree of Bachelor of Technology in Computer Science and Engineering at Madhav Institute of Technology & Science, Gwalior is an authenticated and original record of my work under the mentorship of **Dr. Ranjeet Kumar Singh, Assistant Professor**, Computer Science & Engineering.

I declare that I have not submitted the matter embodied in this report for the award of any degree or diploma anywhere else.

Utkarsh Mishra  
0901CS201130  
II Year,  
Computer Science and Engineering

## **MADHAV INSTITUTE OF TECHNOLOGY & SCIENCE, GWALIOR**

(A Govt. Aided UGC Autonomous & NAAC Accredited Institute Affiliated to RGPV, Bhopal)

### **ACKNOWLEDGEMENT**

The full semester project has proved to be pivotal to my career. I am thankful to my institute, **Madhav Institute of Technology and Science** to allow me to continue my disciplinary/interdisciplinary project as a curriculum requirement, under the provisions of the Flexible Curriculum Scheme (based on the AICTE Model Curriculum 2018), approved by the Academic Council of the institute. I extend my gratitude to the Director of the institute, **Dr. R. K. Pandit** and Dean Academics, **Dr. Manjaree Pandit** for this.

I would sincerely like to thank my department, **Department of Computer Science and Engineering**, **for allowing** me to explore this project. I humbly thank **Dr. Manish Dixit**, Professor and Head, Department of Computer Science and Engineering, for his continued support during the course of this engagement, which eased the process and formalities involved.

I am sincerely thankful to my faculty mentors. I am grateful to the guidance of **Dr. Ranjeet Kumar Singh**, Assistant Professor, Computer Science & Engineering, for his continued support and guidance throughout the project. I am also very thankful to the faculty and staff of the department.

Utkarsh Mishra

Computer Science and Engineering

## ABSTRACT

Using the Prediction Model, the objective is to predict the possibility of rain in a particular area. It would help in obtaining the data of future rain patterns and we can prepare for less or excess rainfall. It would help in predicting if there is any possibility of flood or drought in the coming future. More the accuracy of the model, more it would be trustworthy as the result would be more genuine.

In this **Rain Prediction Model**, we are predicting the rainfall different parts of India by the help of the data that is collected by studying the rainfall in those parts over the past years. It would also help in the future if government wants to provide water to areas where there is scarcity of rainfall by building infrastructures. The prediction model can be used in many more possible ways as water is one of the most important necessity for humankind.

## TABLE OF CONTENTS

## Chapter 1: INTRODUCTION

The motive of the Rain Prediction Model is to predict whether there would be rain in an area at a particular time of the year or not which would be very beneficial as it would help in preparing if there would be shortage of water in a particular area at a particular time of the year. It would also predict if there is any chance of excess of rainfall if there is rainfall in most of the timeframe across the year. The dataset created from the rainfall records of the previous years in the areas across the year is used in this model to predict the future prospects and the pattern of rainfall. With time the model would be able to predict the result with more accuracy as new entries would be edited and the model would grow more and more. The result would not always be guaranteed true but according to the accuracy it would very much be close to the actual result.

The motivation behind the project was to be able to prepare according to the rainfall so that there would be no problem regarding the deficiency or excess of water which could create a hazard and people could know beforehand about the situation of rainfall in their area throughout the year.

The drawbacks of this model could be its inefficiency to predict the correct result every time as a model can never be one hundred percent accurate and there would be always a chance that the predicted result would be different from the actual result and the preparations done according to the predicted result would be a waste.

## **Chapter 2: TOOLS**

### **2.1 HARDWARE REQUIREMENTS:**

- Processor: Minimum 1 GHz; Recommended 2GHz or more.
- Ethernet connection (LAN) OR a wireless adapter (Wi-Fi).
- Hard Drive: Minimum 32 GB; Recommended 64 GB or more.
- Memory (RAM): Minimum 2 GB; Recommended 4 GB or above.

### **2.2 SOFTWARE REQUIREMENTS:**

- Any Web Browser (eg: Chrome).
- Operating system: Windows or MacOs or Linux.
- Language: Python.
- Jupyter Notebook.

## Chapter 3: METHODOLOGY

### Importing additional library

```
import numpy as np
import matplotlib.pyplot as plt
import pandas as pd
from sklearn.model_selection import train_test_split
from sklearn.linear_model import LogisticRegression
from sklearn.metrics import accuracy_score
```

### Load the Dataset

```
rf= pd.read_csv("district wise rainfall normal.csv")
rf.describe()
```

## Chapter 5: RESULT

By the help of the prediction model now we are able to predict whether there would be rainfall in a particular area across the year or not which would be beneficial to prepare for any situation. We used the dataset that is created by the help of the rainfall stats from the previous years. We used Machine Learning libraries and Python to achieve the result. We divided the dataset into training and testing sets. The training set is used to train the prediction model and the testing set was used afterwards to check the accuracy of the model and then modifications were done to increase the accuracy of the prediction system. We used logistic regression to predict the rainfall as it satisfies the dataset and the distribution of the data.

### Predictive System

```
input_data = (28,15,10,2,3,29,28,21,30,31,30,20,110,16,53,120,89)

# change the input data to a numpy array
input_data_as_numpy_array = np.asarray(input_data)

# reshape the numpy array as we are predicting for only one instance
input_data_reshaped = input_data_as_numpy_array.reshape(1,-1)

prediction = model.predict(input_data_reshaped)
print(prediction)
if(prediction[0] == 0):
    print("It won't rain !!")
else:
    print("It will rain !!")

[0]
It won't rain !!
```

Out of the liner and logistic regression, we used logistic as it was best suited according to the dataset and it was doing the work that was needed to be done. The model was trained and tested and then accuracy of the model was checked which came out to be approximate eighty five percent which is decent if not brilliant. It has the potential to predict the rainfall with a decent accuracy with eighty five percent accuracy.

## **Chapter 6: CONCLUSION**

The conclusion that we got after working on the prediction model was that Python and Machine Learning are very important and beneficial in today's world as it is being used in most of the technologies that are around us. They played an important role in this prediction model as well to calculate the result that whether there would be rainfall at a particular time of the year or not. We used various python libraries in this project to achieve our goal and it would be very difficult or may be impossible to develop this project in any other programming language.

At last we conclude that python programming is an important aspect of the programming world as industries like Machine Learning, Artificial Intelligence, Natural Language Processing are fully based on it and would be inefficient without the python language. These industries plays an important role in our life and in the project as well it played an important role to enable it towards its execution.
